

ARES ELITE SPORTS VISION

The Sports Vision Playbook

Your eyes feed your game. Train them like any other athletic system - with a plan, drills, and measurable progress. This is that plan.

5 chapters - a 6-week starter program - drills you can run anywhere

What's inside

Elite athletes don't just have great bodies - they have great visual systems: faster reactions, sharper tracking, wider awareness. The good news is these skills are trainable. This playbook shows you the skills that matter, how to assess them, the drills that build them, and a 6-week program to put it together.

01 The 6 visual skills that win games

Reaction, tracking, focus, depth, peripheral, eye-body.

02 Assess your baseline

Simple at-home tests to score where you start.

03 The drill library

Exercises for each skill, by equipment level.

04 The 6-week starter program

A done-for-you schedule to follow.

05 Measure & beat plateaus

Track progress and keep improving.

The 6 visual skills that win games

Reaction & decision speed

How fast you see a cue and act on it - the difference between a caught ball and a dropped one.

Dynamic tracking

Following fast-moving objects smoothly with your eyes, not your head.

Focus flexibility

Switching clarity between near and far instantly - a receiver reading the ball then the field.

Depth perception

Judging distance and closing speed accurately for timing and spacing.

Peripheral awareness

Seeing the full field while focused on the play in front of you.

Eye-body coordination

Letting what you see drive precise, balanced movement.

Assess your baseline

Before you train, score yourself so you can prove the gains. Use the Training Log & Tracker (companion product) to record these, then re-test weekly.

Quick at-home tests

- Reaction: ruler-drop test (a partner drops a ruler between your fingers; a lower catch = faster) or a reaction app.
- Focus shifts: count how many clear near-to-far switches you make in 30 seconds.
- Peripheral: eyes forward, count catches out of 12 tossed from the edges.
- Balance + vision: time how long you hold a single-leg ball toss without a miss.
- Tracking: read a saccade number chart for 30 seconds and count errors.

Re-test cadence

Re-test once a week, same conditions. Expect small gains in 2-4 weeks and larger improvements over 3-6 months of consistent practice.

The drill library

No equipment

Near-far focus shifts, fixation holds, saccade charts (paper on a wall), single-leg balance holds.

A ball + a wall

Wall reaction tosses, call-the-hand catches, figure-8 tracking, peripheral catches with a partner.

Cheap add-ons

A 5-ft string + beads (Brock string) for convergence; a reaction-light app; strobe-style blink work.

Programming the work

Train 10-20 minutes, 3-5 days a week. Rotate across all six skills - never just your favorites. Quality and focus beat volume.

The 6-week starter program

Three 15-minute sessions a week. Each session: 2 min warm-up (focus shifts) + 3 drills + 1 min gaze-stability cool-down.

WEEKS	FOCUS	SAMPLE SESSION
1-2	Foundations	Focus shifts - wall toss - saccade chart
3-4	Speed & tracking	Call-the-hand catch - figure-8 - Brock string
5-6	Game transfer	Peripheral catch - balance+toss - reaction app

After week 6: re-test your baseline, then keep your two weakest skills as a maintenance circuit.

Measure & beat plateaus

Keep the gains coming

- Progressively overload: add speed, distance, or a decision element as drills get easy.
- Train tired: do a short circuit after physical practice to mimic game fatigue.
- Add sport-specific transfer: end each week rehearsing the exact visual demand of your sport.
- Deload if scores stall for 2 weeks - rest, then return with fresh drills.

Train your eyes like you train your body.

Assess, drill across all six skills, track weekly, progress the load. Consistency wins.

See it. React. Win.

Pair this playbook with the Sports Vision Training Log & Tracker to assess your baseline and measure every gain.

This guide is educational and is not medical or optometric advice. Sports vision training supports performance; it does not diagnose or treat vision conditions. If you have any vision concern, consult a qualified eye-care professional. Train safely and stop any drill that causes pain, dizziness, or eye strain.
